

## Patient information

Prostatype® is a gene test that gives you and your doctor a measure of the degree of aggressiveness of your prostate cancer. Prostatype® combines information from genes with clinical parameters such as Gleason grade, PSA value, & tumor-stage to calculate a risk value called the P-score. P-score gives an indication of how aggressive or non-aggressive your prostate cancer is, which facilitates the choice of treatment.

The test is performed on the tissue samples already existing from the biopsy that taken during the diagnosis of your prostate cancer, so no new biopsy tissue samples are needed.

**If you are requesting to be tested with Prostatype®, please sign this document.**

The test results will be reported to you by your doctor.

**For ordering and price information please contact Prostatype Genomics or your Urologist.**

<b>Patient Name</b>	
<b>Social Security number</b>	
<b>Address</b>	

Prostatype Genomics requests your permission to use the left-over tissue materials (not the biopsies but only the already sectioned materials that will be sent to the laboratory for the test) for the following purposes. If you agree, please check the box/boxes:

- for quality purposes in the laboratory       for clinical studies
