Prostatype® is a gene test that provides a survival prognosis and is a decision support when choosing treatment for diagnosed prostate cancer patients.

Based on the expression level of the genes and clinical parameters such as Gleason grade, PSA value, and tumor stage, a risk value called the P-score is calculated. P-score gives an indication of how aggressive or non-aggressive the prostate cancer is, which facilitates the choice of treatment. This product should only be used on biopsy material from male individuals where a needle biopsy has confirmed the diagnosis of prostate cancer with Gleason Score 6 or higher.

Hospital/ Clinic

Name of the Urologist
